Neo – Music

Objective:

Neo Music is an online application for easily browse and play songs by genres, albums, artists.

Users of the System:

1. Admin
2. User

Functional Requirements:

- Build an application that customer can access the music.
- Admin should provide for automatic tagging of music and categorise them.
- Admin should proper music details such as language, artist, movie name etc..
- User will give the like/dislike for the music
- This application should have a provision to maintain a database for user information, music portfolio
- Authenticity for adding users is utmost important for such a website.
- Definitely one should not be allowed to have more than one profile, validation of user should be done using email id.
- **Categorize the music based on album**.

While the above ones are the basic functional features expected, the below ones can be nice to have add-on features:

- There are lot of freeware & open source applications available for many social functions. The team is expected to search & leverage these to the maximum.
- Multi-factor authentication for the sign-in process

Output/ Post Condition:

- Reports for users
- Reports for Site admin..the operational reports to make the site better in future

Non-Functional Requirements:

Security	• App Platform –UserName/Password-Based Credentials • Sensitive data has to be categorized and stored in a secure manner • Secure connection for transmission of any data
Performance	• Peak Load Performance • Neo Music-< 3 Sec • Admin application < 2 Sec • Non Peak Load Performance
Availability	• 99.99 % Availability
Standard Features	• Scalability • Maintainability • Usability

	• Availability • Failover
Logging & Auditing	• The system should support logging(app/web/DB) & auditing at all levels
Monitoring	• Should be able to monitor via as-is enterprise monitoring tools
Cloud	• The Solution should be made Cloud-ready and should have a minimum impact when moving away to Cloud infrastructure
Browser Compatible	• IE 7+ • Mozilla Firefox Latest – 15 • Google Chrome Latest – 20 • Mobile Ready

Technology Stack

Front End	React Google Material Design Bootstrap / Bulma
Server Side	Spring Boot Spring Web (Rest Controller) Spring Security Spring AOP Spring Hibernate
Core Platform	OpenJDK 11
Database	MySQL or H2

Platform Pre-requisites (Do's and Don'ts):

1. The React app should run in port 8081. Do not run the React app in the port: 3000.
2. Spring boot app should run in port 8080.

Key points to remember:

1. The id (for frontend) and attributes(backend) mentioned in the SRS should not be modified at any cost. Failing to do may fail test cases.
2. Remember to check the screenshots provided with the SRS. Strictly adhere to id mapping and attribute mapping. Failing to do may fail test cases.
3. Strictly adhere to the proper project scaffolding (Folder structure), coding conventions, method definitions and return types.
4. Adhere strictly to the endpoints given below.

Application assumptions:

1. The login page should be the first page rendered when the application loads.
2. Manual routing should be restricted by using AuthGaurd by implementing the canActivate interface. For example, if the user enters as http://localhost:3000/signup or http://localhost:3000/home the page should not navigate to the corresponding page instead it should redirect to the login page.
3. Unless logged into the system, the user cannot navigate to any other pages.
4. Logging out must again redirect to the login page.
5. To navigate to the admin side, you can store a user type as admin in the database with a username and password as admin.
6. Use admin/admin as the username and password to navigate to the admin dashboard.

Validations:

1. Basic email validation should be performed.
2. Basic mobile validation should be performed.

Project Tasks:

API Endpoints:

USER			
Action	URL	Method	Response
Login	/login	POST	true/false
Signup	/signup	POST	true/false
Get All Music	/music	GET	Array of Music
Get Music	/music/{id}	GET	Music Details
Add Likes	/like/{id}	POST	Like added to Songs
Remove Likes	/like/{id}	DELETE	Like removed
ADMIN			
Action	URL	Method	Response
Get All User	/admin	GET	Array of Users
Add User	/admin/add User	POST	User added
Delete User	/admin/delete/{id}	DELETE	User deleted
User Edit	/admin/userEdit/{id}	PUT	Save the Changes
Get All Music	/admin/music	GET	Array of Music
Delete Music	/admin/music/{id}	DELETE	Song deleted
Update Music	/admin/music/{id}	PUT	Save the Changes
Get All Comment	/admin/comment	GET	Array of Comments

Class and Method description:

Model Layer:

1. UserModel: This class stores the user type (admin or user) and all user information.
    a. Attributes:
        i. email: String
        ii. password: String
        iii. username: String
        iv. mobileNumber: String
        v. active: Boolean
        vi. role: String
    b. Methods: -

2. LoginModel: This class contains the email and password of the user.
    a. Attributes:
        i. email: String
        ii. password: String
    b. Methods: -
3. MusicModel: This class stores the details of the product.
    a. Attributes:
        i. musicId: String
        ii. musicName: String
        iii. musicUrl: String
        iv. musicPosterUrl: String
        v. musicAlbum:String
        vi. musicArtist: String
        vii. like: LikeModel
    b. Methods: -
4. LikeModel: This class stores the cart items.
    a. Attributes:

i. Id: String
ii. noOfLike: int
iii. likedUser: List<UserModel>

b. Methods: -

Controller Layer:

5. SignupController: This class control the user signup
    a. Attributes: -
    b. Methods:
        i. saveUser(UserModel user): This method helps to store users in the database and return true or false based on the database transaction.
6. LoginController: This class controls the user login.
    a. Attributes: -
    b. Methods:
        i. checkUser(LoginModel data): This method helps the user to sign up for the application and must return true or false
7. UserController: This class controls the add/edit/update/view User.
    a. Attributes: -
    b. Methods:
        i. List<UserModel> getUser(): This method helps the admin to fetch all User from the database.
        ii. List< UserModel > getOnlineUser(): This method helps to retrieve all the online user from the database.
        iii. userModel userEditData(String id): This method helps to retrieve a user from the database based on the user id.
        iv. userEditSave(UserModel data): This method helps to edit a user and save it to the database.
        v. userDelete (String id): This method helps to delete a user from the database.
8. MusicController: This class helps in adding music, deletingmusic, updating updating.
    a. Attributes: -
    b. Methods:
        i. addMusic(MusicModel image): This method helps the user to add the music to the database.
        ii. List<MusicModel> getAllMusic(): This method helps the user to fetch all the music from the database.

iii. MusicModel showMusic(String id): This method helps the user to play the music.

iv. deleteMusic(String id): This method helps to delete a music from the database.

v. updateMusic(MusicModel data): This method helps to update a music details from the database.

9. CommentController: This class helps in adding, deleting, updating the comment.
    a. Attributes: -
    b. Methods:
        i. addLike(String Id): This method helps the user to add the Like for the selected song.
        ii. removeLive (String id): This method helps to remove a Like from the song.
        iii. getLikeCount(String id): This method will return the number likes based on song id.
